Introduction

Computer Science Engineering student specializing in Healthcare Informatics at VIT Bhopal University, passionate about AI/ML, full-stack development, and healthcare technology. Experienced in building intelligent applications using Python, Flask, React, NLP, and machine learning with a focus on solving real-world healthcare challenges through data-driven solutions.

Education

VIT Bhopal University

BTech – Computer Science Engineering (Healthcare Informatics)

CGPA: 8.53 / 10

Aug. 2023 – Present

Kendriya Vidyalaya No. 1 Airforce Hindon, Ghaziabad

Higher Secondary (Science) · 86.8%

2020 – 2021

Relevant Coursework

- Data Structures & Algorithms
- Machine Learning
- Artificial Intelligence
- Natural Language Processing
- Database Management Systems
- Object-Oriented Programming

Projects

MedCore AI — Intelligent Healthcare CX Platform | Python, FastAPI, React, NLP, Sentiment Analysis 2026

- Built a full-stack AI healthcare platform with a FastAPI backend and React frontend, featuring five integrated modules: intelligent query triage, agent assist, sentiment analysis, analytics dashboard, and a live case queue
- Designed a multi-stage NLP triage pipeline (tokenize → classify intent → detect urgency → score 0–100 → route to department) with a real-time agent-assist module generating response suggestions and next-best-actions
- Implemented a lexicon-based emotion classifier (Angry/Anxious/Neutral/Satisfied) with polarity scoring (−1 to +1) and hourly sentiment trend analytics using Recharts

SupportDesk — Ticket Management System | Python, Flask, SQLite, REST API, HTML/CSS/JS 2026

- Developed a production-grade CRM web app with a RESTful Flask backend and SQLite database supporting full ticket lifecycle management — create, track, prioritize (High/Medium/Low), update status, and delete
- Built a real-time analytics dashboard displaying live KPI counts (Total/Pending/In-Progress/Resolved) with color-coded priority indicators, real-time search, independent filters, and auto-refresh every 30 seconds
- Implemented both client-side and server-side input validation with XSS prevention, keyboard shortcuts (🔍 search, ➕ new), and smooth modal/toast animations for a polished UX

Health Risk Prediction System (Baymax) | Python, Scikit-learn, Pandas, ML Classification, Google Colab 2025

- Trained and compared three supervised ML models (Logistic Regression, Random Forest, KNN) on the Pima Indians Diabetes Dataset (768 records, 8 features) to predict diabetes risk — Random Forest achieved the highest accuracy
- Applied comprehensive data preprocessing: replaced invalid zero values with column means, performed EDA with correlation heatmaps and feature distribution plots, and normalized input features for model stability
- Built a risk classification output system (Low/Moderate/High) that takes 8 patient inputs and returns diabetes probability score alongside risk level, designed with future Streamlit/Flask deployment in mind

Technical Skills

Languages: Python, SQL, Java, C++

AI / ML & NLP: Machine Learning, NLP, Sentiment Analysis, Scikit-learn, Predictive Analytics, Model Evaluation, Data Preprocessing, FastAPI

LLM & GenAI: Prompt Engineering, ChatGPT, Claude, Gemini

Backend & Tools: Flask, REST APIs, SQLite, React (Basic), Git, GitHub, Docker (Basic), Linux, Jupyter Notebook, Power BI (Basic)
